

1. Demographics

Demographic indicators explain the characteristics of human populations and population segments, and are especially helpful when used to identify consumer markets. This information can be beneficial to businesses and governments in defining the demand or need for specific products and services in the area.

Between 1994 and 2004, population increased 18.5 percent in El Dorado County. The quality of life in the Sierra Nevada Foothills is luring people away from Sacramento. In fact, El Dorado County, with home prices slightly lower than the neighboring Sacramento County, has seen its population nearly triple from 6,395 in 1990 to 18,083 in 2000. That is an increase of 183 percent in ten years. This population surge is driven by the desire for a higher quality of life and the convenience of close proximity to Sacramento.

Total population

Overview

Total population is an estimate of the number of people living in a certain area, including incarcerated persons, residents working in other counties, and county residents in city annexations.

Total population is used to calculate the growth rate of a specific area. Public officials and business owners use these figures to determine where and how much people need their services. The growth rate is also used to calculate projections for population figures.

The three-year moving average is used in order to smooth out trends for areas of highly volatile data (data subject to frequent change). The three-year moving average makes erratic changes in trends less difficult to identify, and it is calculated by taking the average of the year in question, the previous year, and the following year.

* Data for 1991 is not comparable to the previous year due to a change in methodology.

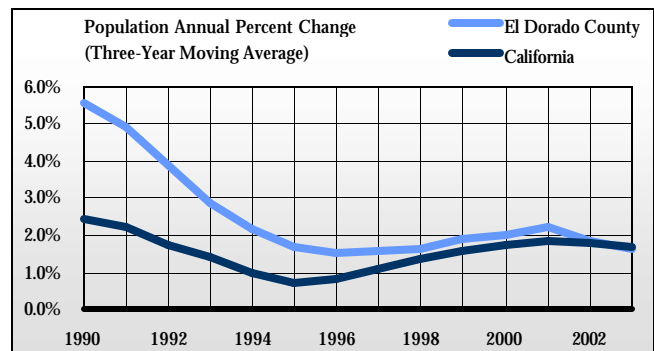

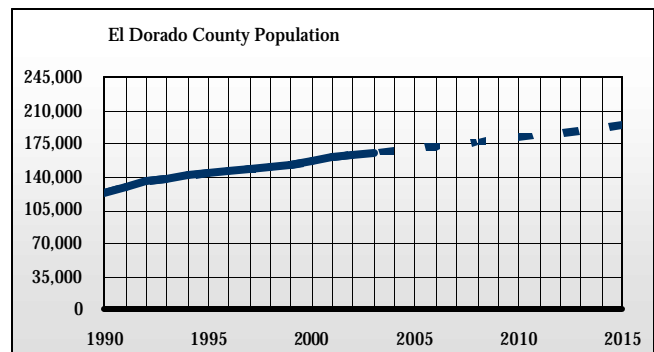

County Population		
Year	Population	Annual percent change
1990	123,900	n/a
1991*	130,200	5.1%
1992	134,900	3.6%
1993	138,800	2.9%
1994	141,800	2.2%
1995	143,900	1.5%
1996	145,900	1.4%
1997	148,400	1.7%
1998	150,900	1.7%
1999	153,200	1.5%
2000	157,100	2.5%
2001	160,200	2.9%
2002	163,600	1.2%
2003	165,900	1.4%
2004	168,100	1.3%
2010(p)	181,800	1.3%
2015(p)	195,000	1.4%

El Dorado County

El Dorado County is currently home to nearly 168,100 people, with a projected population of 195,000 by 2015. This projection is supported by the fact that population increase has been steady for the last ten years, with an average annual increase of 3,420 people (2.2 percent). Between 1994 and 2004, the total population increased 18.5 percent in the county. This steady increase is due to a greater number of births than deaths in the area and a steady growth in employment opportunities (see section 1.3, "Components of Population Change" and section 4.2, "Total Employment").

See the graph below for more details on El Dorado County's growing population from 1990 to 2015 (projected).

Population by City

Overview

Population by city often gives a more accurate representation of the demographics of a particular area by showing population clusters within the area. Advertising companies and business owners use city population numbers to decide in which cities their particular businesses could thrive. Population growth by city also helps identify rapidly developing new markets.

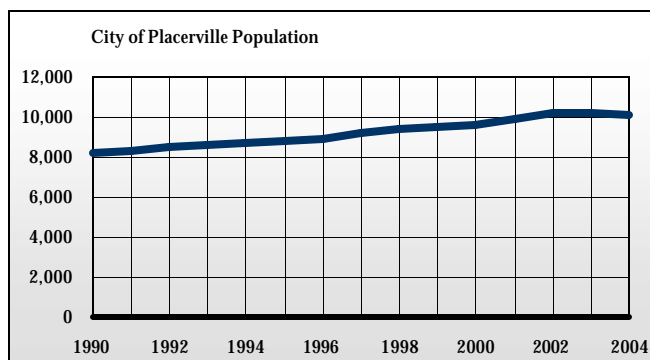

El Dorado County

Of the two incorporated cities in El Dorado County, the city of South Lake Tahoe was the most populous, with 23,600 people in 2004. However, the city of Placerville was the fastest growing incorporated city in the county, with an annual average population increase of 1.5 percent between 1994 and 2004. South Lake Tahoe follows, with an annual average increase of .4 percent during the same time. This is probably due to an increase in available housing in from 2001 to 2004 (see section 7.1, "Total Housing Units"). The following figures present population data by city from 1990 to 2004.

City of Placerville Population

Year	Population	Annual percent change
1990	8,200	n/a
1991*	8,350	1.8%
1992	8,500	1.8%
1993	8,650	1.8%
1994	8,750	1.2%
1995	8,875	1.4%
1996	8,950	0.8%
1997	9,250	3.4%
1998	9,450	2.2%
1999	9,500	0.5%
2000	9,650	1.6%
2001	9,950	3.1%
2002	10,250	3.0%
2003	10,200	-0.5%
2004	10,150	-0.5%

Components of Population Change

Overview

Three factors make up the components of change: the number of births, the number of deaths, and the total change in population from the previous year. Statisticians use these numbers to determine the natural increase and net migration of a particular area. Natural increase is the difference between the number of births and deaths. (See section 9 for the leading causes of death in El Dorado County). Net migration is the total change in population minus the natural increase. Components of change may also be indicative of a prospering or failing economy. For example, many people may often choose to move or have children based on their income or employment opportunities in the area.

*Data for 1991 is not comparable to the previous year due to a change in methodology.

El Dorado County

In 2003, there was a net migration of 2,170 people to El Dorado County. There were 1,802 births and 1,172 deaths in the county in the same year, resulting in a natural increase of 630 people. The figures below present the components of population change in El Dorado County since 1990.

Components of Population Change

Year	Total change	Births	Deaths	Natural increase	Net migration
1990	8,500	1,894	877	1,017	7,483
1991*	5,800	1,993	874	1,119	4,681
1992	3,600	1,863	872	991	2,609
1993	4,200	1,786	830	956	3,244
1994	1,900	1,800	962	838	1,062
1995	2,100	1,776	992	784	1,316
1996	2,100	1,685	1,057	628	1,472

Age Distribution

Overview

Age distribution information is most valuable to companies who target specific age groups in their advertising. The age distribution in a given area affects the area's school system, public services, and overall economy. An area with a large number of young children, for example, will be attractive to owners of toy stores, day cares, and family recreation parks. Age distribution information is also used in conjunction with components of population change in order to make projected population estimates.

El Dorado County

The largest age group in El Dorado County in 2004 was the 40-49 year-old range, with 31,714 people. This number represents approximately 18.5 percent of El Dorado County's population, which is over 3 percent higher than the statewide average. Since 1990, the number of people between the ages of 50-59 increased 6.9 percent, while those between 30-39 decreased 8.3 percent, causing a 4.7 percent decrease among children between 0-9. These

trends may indicate that the number of jobs for those between 30-39 has declined, while those looking towards retirement are migrating into the area. Simultaneously, residents over 60 make up a higher percentage of the population in El Dorado County than the state average.

By 2015, the number of people between the ages of 10-19 and 40-49 is expected to decrease the most. Those between the ages of 60-69, followed by 20-29 year-olds, are projected to see the highest increase. See the following chart for more details on age distribution in El Dorado County since 1990.

El Dorado County Age Distribution

Year	0-9	10-19	20-29	30-39	40-49	50-59	60-69	70-79	80+
1990	20,056	16,318	15,053	24,869	19,442	11,339	11,213	6,620	2,359

Population by Race/Ethnicity

Overview

Statistics regarding population by race and ethnicity are determined by what respondents to the U.S. Census consider as their primary ancestry. American Indian, Asian, black, and white are racial designations, while Hispanic is an ethnic designation that may be a mixture of white, black, and American Indian races. The Hispanic population was grouped separately in the census because many Hispanic people associated with their ethnicity rather than race. In this section, the five racial/ethnic groups are mutually exclusive.

Population by race statistics is used by grant writers and advertising companies to market products to a particular ethnic group. Grant writers use race/ethnicity information to determine whether investments in certain businesses are likely to be lucrative. Investing in an upstart radio station is a better investment in a predominantly Hispanic area because statistics show that Hispanics listen to the radio for entertainment more than other ethnic groups. Advertising companies use race/ethnicity data in order to make their advertisements appealing to the ethnic groups

El Dorado County Population by Race/Ethnicity

Year	Total	White	Hispanic	Asian	Black	American Indian

that are common in a given area. Government officials and political candidates also use race/ethnicity data in order to tailor their campaigns to distinct ethnic groups in certain locations.

El Dorado County

Approximately 83.2 percent of residents in El Dorado County classified themselves as white in 2004. Hispanics represented the next largest group, with 10.3 percent of the population, or 17,626 people, compared to 35.2 percent, or 12,816,038 people, in California. The Hispanic population is projected to increase 41 percent by 2015 in El Dorado County. Asians and American Indians are the next largest groups, with 4,650 and 2,154 people respectively, and blacks are the smallest census-classified

group, with 1,064 people. By 2015, American Indians are projected to increase 90 percent, while whites are expected to increase 8 percent. The following figures show El Dorado County's population by ethnicity since 1990.

Population by Race/Ethnicity, 1990

Population by Educational Attainment

Overview

Educational attainment information is used by businesses for market research, primarily by those wishing to target customers of a particular educational level. This information is also useful in determining the types of jobs that a particular area's economy is able to support. Additionally, an area with a large number of college graduates usually translates into higher wage-earning potential and a more diverse buyer market.

Data here represents the number of people 18 years and over who have achieved a specified level of education

El Dorado County

In 2000, 31.5 percent of El Dorado County's residents, had some college but earned no degree, making them the largest educational group in the area. This rate is higher than the rest of the state in which 24.3 percent of all residents claim some college but have earned no degree. High School graduates and residents holding bachelor's degrees are the next most common educational groups in El Dorado County, at 23.5 and 16.7 percent, respectively.

El Dorado County is above the statewide average in residents holding high school diplomas, associate's degrees, and bachelor's degrees.

Population by Educational Attainment, Population 18 and Over, 1990

Land Area & Population Density

Overview

Population density is used to define the differences between urban and rural areas. This distinction is necessary in grant writing and when comparing different counties or areas. Population density is determined by dividing the total population of the area in question by that area's size in square miles.

*Data for 1991 is not comparable to the previous year due to a change in methodology.

El Dorado County

El Dorado County's total land area is 1,710.8 square miles. Because population has increased while land area has remained constant, El Dorado County's population density has steadily risen over time. As of 2004, the population density in the county was 98.3 residents per square mile, putting it well below the statewide average population density of 231.8 people per square mile. It is projected that by 2015 the population density in El Dorado County will reach 114 people per square mile.

Land Area and Population Density

Year	Land area (sq.miles)	Total population	Population density (per sq.mile)
1990	1,710.8	123,900	72.4
1991*	1,710.8	130,200	76.1
1992	1,710.8	134,900	78.9
1993	1,710.8	138,800	81.1
1994	1,710.8	141,800	82.9
